

QR check-in is here.

Every event registrant now gets a personal check-in code in their confirmation email. Whenever an event happens – Sunday service, Wednesday night, a Saturday outreach, a Friday-to-Sunday retreat – your team scans them in with any phone or tablet. Less line, more welcome.

1.8.0	Now	None	Zero – already on

WHY IT MATTERS

The check-in table just got **a lot faster**.

Whether it's a Sunday-morning service, a midweek dinner, or a weekend retreat, the bottleneck at the check-in table is almost always the same: a volunteer thumbing through a printed list or scrolling a tablet looking for someone's name. QR check-in collapses that to a single scan.

Seconds, not minutes

One scan = one check-in. A line of 30 people clears in under a minute.

No app to install

Volunteers use the existing check-in screen in any browser. Registrants use their email.

Quiet on the back end

Every scan logs the same audit trail as a manual check-in. Your reports don't change.

What attendees **see and do.**

There's nothing new for them to learn. The same confirmation email they already get just has a little more in it – and they don't need to do anything with it until they arrive.

1 They register normally

Same form, same flow as before. Nothing changes here.

2 Their confirmation email now includes a personal QR

A black-and-white square code, plus the words "Show this code at check-in." Same email that already has the date, time, location, and a link to manage their registration.

3 When they arrive, they pull the email up on their phone

They don't even have to open the email – most phones surface the QR right in the preview. If they lose the email, the same QR also appears on the "Manage My Registration" page, so they can pull it up from any browser.

4 They walk up. Volunteer scans. Done.

No name spelling, no clipboard hunting, no "are you in the system?"

A bonus you didn't ask for: the same email also got "Save to your calendar" buttons for Google, Apple, and Outlook. One tap puts the event on their calendar with the right title, time, and location pre-filled. Fewer no-shows because nobody forgot when it was.

How to scan people in **at the event.**

Anyone who can use the existing check-in screen can use the scanner – there's nothing new to learn beyond pointing a camera at a code. Works for any event regardless of day or time.

1 Open the Check-In screen in your WordPress admin

Church Events → Check-In. Use any device with a camera: laptop, iPad, or your phone. The site needs to load on https:// (yours does – required for camera access).

2 Pick the event you're checking people in for

Use the dropdown at the top of the screen. Events happening today are flagged with a "TODAY" label so you can grab the right one quickly – but you can pick any event in the list, whatever day or time it runs.

3 Tap Scan QR

A modal opens with a live camera preview. First time you do this on a new device, the browser will ask permission to use the camera – say yes once and it remembers.

4 Hold the camera up to each registrant's QR

As soon as the code is in frame, you'll hear a soft "ka-ching" chime and a green "✓ Checked in: [Name]" banner flashes. The scanner stays open – just keep moving to the next person. Phones display the QR in the email preview, so most registrants don't even need to open the email.

5 The line clears

Need to add a walk-in? Hit "Add Walk-in" right next to the scan button. Need to find someone whose phone died? The name search still works exactly as before. Use whichever fits the moment.

What we've already been asked.

– What if someone shows me the wrong QR code?

The scanner checks the code against the currently-selected event's registrants. If it's not in that event, you'll see a red "Not registered for this event" banner with a low buzz – no risk of checking someone into the wrong event by mistake.

– What if someone scans their QR twice?

The second scan shows an amber "Already checked in: [Name]" banner. No double counts, no confusion.

– What if a registrant doesn't have their phone?

The name search on the check-in screen works exactly like it did before – type a few letters, tap their card. The QR is a faster lane, not the only lane.

– Does this work for multi-day events (retreats, conferences)?

Yes. The QR is tied to the registration, not a specific day. The same code works whether you scan it Friday night or Sunday morning.

– What if our internet is spotty?

The scanner runs in the browser and checks codes against a list already loaded for the event. You only need internet to load the page at the start of check-in – after that, scans work on the cached list.

– Does this cost more?

No. It's included with your existing plugin at no extra cost. The QR codes are generated on your own site – nothing is sent to a third-party service.

– Can attendees print the QR instead of using their phone?

Yes. The QR is on the manage-registration page as well as in the email – they can print either one, and the scanner reads it off paper just as easily as off a screen.
